| STEP 1: TEAM GATHERING & PROBLEM STATEMENT                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | STEP 2: BRAINSTORMING, IDEA LISTING & GROUPING                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <div style="margin-bottom: 10px;">  <b>Problem Statement (How Might We)</b><br/> <p>How might we leverage ServiceNow to automate network requests such as VPN access, IP allocation, Wi-Fi access, and switch port requests to reduce manual effort, ensure secure approvals, improve accuracy, and provide real-time visibility to users and IT teams?</p> </div> <div>  <b>Team Members</b> <ul style="list-style-type: none"> <li><b>ServiceNow Developer</b> – Builds catalog items, workflows and automations</li> <li><b>Network Administrator</b> – Provides network expertise and implements changes</li> <li><b>IT Support Engineer</b> – Handles user requests and issue resolution</li> <li><b>Security Analyst</b> – Reviews high-risk requests and ensures compliance</li> <li><b>Business Analyst</b> – Gathers requirements and improves user experience</li> </ul> </div> | <div style="margin-bottom: 10px;">  <b>Cluster 1: User Request Management</b> </div> <ul style="list-style-type: none"> <li>Create a Service Catalog item for network requests</li> <li>Design a simple and clear request form</li> <li>Add mandatory validations for user inputs</li> <li>Show/hide fields dynamically based on request type</li> </ul> | <div style="margin-bottom: 10px;">  <b>Cluster 2: Workflow Automation</b> </div> <ul style="list-style-type: none"> <li>Automatically route requests to the right network team</li> <li>Auto-approve low-risk requests</li> <li>Send high-risk requests for manager approval</li> <li>Send email notifications for status updates</li> <li>Create tasks automatically for network engineers</li> </ul> | <div style="margin-bottom: 10px;">  <b>Cluster 3: Testing &amp; Deployment</b> </div> <ul style="list-style-type: none"> <li>Test catalog variables and form validations</li> <li>Verify approvals and email notifications</li> <li>Perform UAT with end users</li> <li>Deploy the solution after successful testing</li> </ul> |

  

| STEP 3: IDEA PRIORITIZATION (IMPORTANCE VS. FEASIBILITY)                                                                                 |                                                                  |                                                                                                                            |
|------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| PRIORITY LEVEL                                                                                                                           | IDEA / TASK                                                      | JUSTIFICATION                                                                                                              |
| <br>High Importance, High Feasibility (Do Now)        | Build Network Request catalog item with validations              | Essential for capturing correct request information; easy to implement using ServiceNow catalog variables and UI policies. |
| <br>High Importance, High Feasibility (Do Now)        | Configure Flow Designer workflows and approvals                  | Critical for request routing and governance; achievable with out-of-the-box ServiceNow capabilities.                       |
| <br>High Importance, Low Feasibility (Plan Carefully) | Integrate with external network systems (IPAM, VPN, Switch APIs) | Provides maximum automation value but requires API access, credentials and network system configurations.                  |
| <br>Medium Importance, High Feasibility (Do Next)     | Configure automatic email notifications                          | Improves communication and visibility; easy to implement using standard notifications.                                     |
| <br>Low Importance, Medium Feasibility (Later)        | Generate reports and dashboards for network requests             | Useful for monitoring and analysis but can be implemented after core automation is stable.                                 |

# Step-1: Team Gathering, Collaboration and Select the Problem Statement

## Problem Statement (How Might We)

How might we develop an automated network request management system using ServiceNow that enables users to submit network-related requests through a single portal, routes requests to the appropriate teams automatically, minimizes manual effort, improves approval efficiency, and provides real-time status updates throughout the request lifecycle?

## Team Gathering

To successfully design and implement this solution, our project team includes:

- **ServiceNow Developer** – Develops the Service Catalog, configures Flow Designer workflows, and automates request processing.
- **Network Engineer** – Reviews network requirements and executes technical network configurations when required.
- **System Administrator** – Manages platform settings, user roles, and system maintenance.
- **Quality Assurance (QA) Tester** – Tests catalog items, workflows, approvals, and notifications to ensure smooth operation.
- **Business Analyst** – Collects user requirements, identifies business needs, and validates that the solution meets organizational objectives.

## Project Objective

The objective of this project is to automate the complete network request process using ServiceNow. Users can submit requests through a Service Catalog form, approvals are processed automatically based on predefined rules, notifications are sent at each stage, and the entire request is tracked efficiently from submission to completion. This improves productivity, reduces processing time, and enhances the overall user experience.

## Step-2: Brainstorm, Idea Listing and Grouping

### Cluster 1: Service Catalog & User Experience

- Create a Network Request catalog item with an easy-to-use request form.
- Collect essential user information such as User Name, Email ID, Phone Number, Request Type, and Description.
- Apply mandatory field validation to prevent incomplete requests.
- Use UI Policies to display relevant fields based on the selected request type.
- Allow users to track the status of their submitted requests.

### Cluster 2: Workflow Automation & Approvals

- Automate request routing using Flow Designer.
- Send low-priority requests directly to the network support team.
- Route high-priority or sensitive requests for manager approval before execution.
- Automatically create tasks for network engineers after approval.
- Send email notifications whenever the request status changes.

### Cluster 3: Testing, Monitoring & Reporting

- Test catalog forms, variables, and workflow execution.
- Verify approval and notification processes.
- Generate reports to monitor request completion time and pending requests.
- Collect user feedback to improve the request process.
- Ensure all request records are maintained for future reference and auditing.

## Step-3: Idea Prioritization (Importance vs. Feasibility)

| Priority Level | Idea / Task | Justification |
|----------------|-------------|---------------|
|                |             |               |

|                                                             |                                                                                                  |                                                                                                                |
|-------------------------------------------------------------|--------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| High Importance, High Feasibility (Do Now)                  | Create the <b>Network Request</b> Service Catalog item with required variables and validations.  | Forms the foundation of the project and ensures users submit complete and accurate requests.                   |
| High Importance, High Feasibility (Do Now)                  | Configure <b>Flow Designer</b> to automate request routing, approvals, and notifications.        | Reduces manual work, speeds up request processing, and improves efficiency using built-in ServiceNow features. |
| High Importance, Medium Feasibility (Implement Next)        | Add approval workflows based on request type and priority.                                       | Ensures secure handling of sensitive requests while allowing routine requests to be processed quickly.         |
| Medium Importance, High Feasibility (Quick Win)             | Configure automatic email notifications for request submission, approval, and completion.        | Keeps users informed throughout the request lifecycle and improves communication                               |
| Medium Importance, Medium Feasibility (Future Enhancement ) | Develop reports and dashboards to monitor request status, processing time, and team performance. | Provides valuable insights for administrators to improve service quality and operational efficiency.           |
