

Project design Phase

Proposed Solution

Date	29-06-2026
Project Name	Automated Network Request Management
Team ID	
Maximum Marks	

Here is the proposed architectural solution for the Automated Network Request Management (ANRM) project, detailing the core platform components, technical parameters, and their specific execution mechanics.

Proposed Architectural Solution

S.No.	Parameter	Description
1	User Interface Layer	ServiceNow Service Portal where users submit network access requests through a structured catalog form.
2	Request Intake Layer	Captures user inputs and performs initial validation using catalog UI policies and client scripts.

3	Workflow / Orchestration Layer	Flow Designer routes requests based on rules such as low-risk auto-approval or manager/security approval.
4	Business Logic Layer	Applies decision rules, validation checks, and conditional routing for different network access types.
5	Integration Layer	Integration Hub connects ServiceNow with external network devices using secure REST APIs for configuration changes.
6	Security Layer	Ensures authentication, role-based access control (RBAC), and secure credential storage for all operations.
7	CMDB Layer	Updates configuration items and maintains relationships between users, devices, and network resources.
8	Notification Layer	Sends real-time alerts via email or messaging tools for submission, approval, and completion updates.
